

Hello, world!

Why is L^AT_EX so popular with scientists? One big reason is that it's good with math and equations. Consider, for example, the equation for a linear regression:

$$Y = \alpha + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_n x_n + \epsilon$$

Can you imagine any easier way of typesetting such an equation?

Other reasons why people like it:

1. Free
 - (a) I'm cheap
 - (b) I love free stuff
2. Open-source
3. Cross-platform
